TUBERCULOSIS IN CATTLE.

EFFORTS OF THE STATE BOARD OF HEALTH TO STAMP OUT THE DISEASE.

nd the spending of a considerable sum of ney to bring to a successful issue. It is the nping out in cattle of the disease commonly wn as tuberculosis. This disease has been makg rapid headway in the last few years, and the inditions now are such that it is not known how any cattle in the State are afflicted with it. In many cattle in the State are afflicted with it. In the last year the employes of the Health Board have been kept busy night and day in making examinations of cattle which were suspected of haying tuberculosis. These men, no matter how hard they worked, could not keep up with the constantly growing cases brought to the attention of the officials of the State Board of Health, and now there are many thousand head of cattle which have been examined and are to be killed, after an examined and are to be killed just as soon as an appropriation can be made for that purpose. The loss to owners and to the State cannot help being enormous, on account of the killing of animais found to be troubled with this disease. The State has taken upon itself the responsibility of paying something for each buil or cow killed pursuant to the orders of the State Board of Health, and Mc the number of diseased cattle increases within the next two years at the state Board of Health, and Mc the number of diseased cattle increases within the next two years at the key have a within the next two years at the state Board of Health, and Mc the number of diseased cattle increases within the next two years at the key have a state of the State Board of Health, and Mc the number of diseased cattle increases within the next two years at the key have a state of the State Board of Health, and more than State Board of Health and the tenth of the only place where our neterogeness manual in the Boomingdale Reformed Church. All local Americans, Irrespective of race or religion, are agreed that our public school system must be maintained at all hazards. All had have a subject of the Boomingdale Reformed Church. All had been agreed at the Bloomingdale Reformed Church. All had been and in partial. All loc number of diseased cattle increases within the next assert that he will be the next Republican candiyears as it has increased within the last year date for Congressional honors. On several occaor so the question of raising a fund for paying the owners of blooded and native cattle will become a serious one for the State officials and the taxpayers cause a larger expense to get the upper hand of it The Democratic machine, which was responsible for the appropriations which were made by the last Legislature, and the men who controlled the macountry examining cows for tuberculosis. On that

of Health ran out of funds some time ago, and now can do practically nothing toward stopping the ad-

standing, and it only has been within the last year or so that any number of cattle have shown sympalone it would not be so serious a matter, but the danger of a human being contracting the disease from the milk of a cow afflicted with tuberculosis has caused many serious discussions among medical scientists. It is said by members of the State Board scientists. It is said by members of the State Board low his nomination.

That Connecticut is so distinctively termine without a doubt that a cow has or has not tuberculosis. Tols test is the injection, hypodermidegrees. The records of the State Board of Health show that this test has been applied in numerous cases where experienced veterinary surgeons have, after a careful examination, declared that there was no tuberculosis and gave the animal in question clean bill of health. In every case where this injection has been made, and where there has been the rise in the temperature to the specified point, an culosis. In a number of cases it has been found that the udder had more or less of the germs. These were animals the milk from which was being sent for the form of the form of the control of the germs. These were animals the milk from which was being sent for the form of the control of the autopsy of the animal showed that there was tuberdaily out for use by families. Blooded stock seems to suffer the most in proportion to their number, and the State will be compelled within the next year or two to pay out a large sum of money, if the present policy is adhered to, for valuable cattle which will be killed by the house of the proportion of the present policy is adhered to, for valuable cattle which will be killed by the house of the proportion of the proportion of the present policy is adhered to, for valuable cattle which will be killed by the house of the proportion of the propor to pay full value for the animals which are
